

Palindrome Checker using JavaScript & Bootstrap

Installation (make sure you Visual Code and Live Server extension installed)

Make sure you have visual source code installed and extension called "live server" also installed

Create an empty project like this and create two empty files inside the folder.

Build the HTML Page

<> main.html ●

Color-Buttons > <> main.html

1 ht

🔧 html
🔧 **html:5**
🔧 html:xml

Inside main.html file, use a tag `html:5`, and this will create a basic HTML page as shown below.

<> main.html ×

Color-Buttons > <> main.html > 📦 html

```
1 <!DOCTYPE html>
2 <html lang="en">
3 <head>
4   <meta charset="UTF-8">
5   <meta name="viewport" content="width=device-width, initial-scale=1.0">
6   <title>Document</title>
7 </head>
8 <body>
9
10 </body>
11 </html>
```

Update the page

<> main.html ×

Palindrome > <> main.html >  html

```
1  <!DOCTYPE html>
2  <html lang="en">
3
4  <head>
5  |   <title>Palindrome Checker</title>
6  </head>
7
8  <body>
9
10 </body>
11
12 </html>
```

Update the HTML code as shown with head and body tag to keep things simple.

Next press "Go Live" button at the bottom of your VS Code, this will open a new chrome web page for you as shown below.

Update the page

<> main.html ×

Palindrome > <> main.html > html

```
1 <!DOCTYPE html>
2 <html lang="en">
3
4 <head>
5   <link href="https://cdn.jsdelivr.net/npm/bootstrap@5.0.2/dist/css/bootstrap.min.css" rel="stylesheet">
6   <title>Palindrome Checker</title>
7 </head>
8
9 <body style="background-color: powderblue;">
10  <h1>Palindrome Checker</h1>
11
12    <div class="input-group mb-3 w-50">
13      <span class="input-group-text">Enter</span>
14      <input type="text" id="check-pal" class="form-control" placeholder="Enter word or a sentence">
15      <button class="btn btn-primary btn-md">Check</button>
16    </div>
17
18    <script src="index.js"></script>
19 </body>
20
21 </html>
```

← Make sure to include index.js file

We need to make our HTML Page nicer. For this, let's use Bootstrap. So Bootstrap is a free library which we can use which we can get a nicer looking and responsive UI (will work on desktop and mobile devices). For this, in the header, simply link the stylesheet of the latest Bootstrap library as shown. This is the link you can copy: `<link href="https://cdn.jsdelivr.net/npm/bootstrap@5.0.2/dist/css/bootstrap.min.css" rel="stylesheet">` In the div class, we are using `w-50`, which means make the width as 50 pixels.

Update the page

Palindrome Checker

Enter Check

The UI will look like this.

```
<body style="background-color: powderblue;">
  <h1>Palindrome Checker</h1>
  <div class="input-group mb-3 w-50">
    <span class="input-group-text">Enter</span>
    <input type="text" id="check-pal" class="form-control" placeholder="Enter word or a sentence">
    <button class="btn btn-primary btn-md">Check</button>
  </div>
  <script src="index.js"></script>
</body>
```

This is to set the width of 50pix and mb-3 is margin. We will use id of the input type to get the content typed by user.

Update the page

JS index.js × main.html

Palindrome > JS index.js > isPalindrome

```
1  const userInput = document.getElementById("check-pal");
2
3  function isPalindrome(){
4      const value = userInput.value;
5      alert(value);
6  }
```

Write the index.js file, first get the user input. Write a function to alert (a test output).

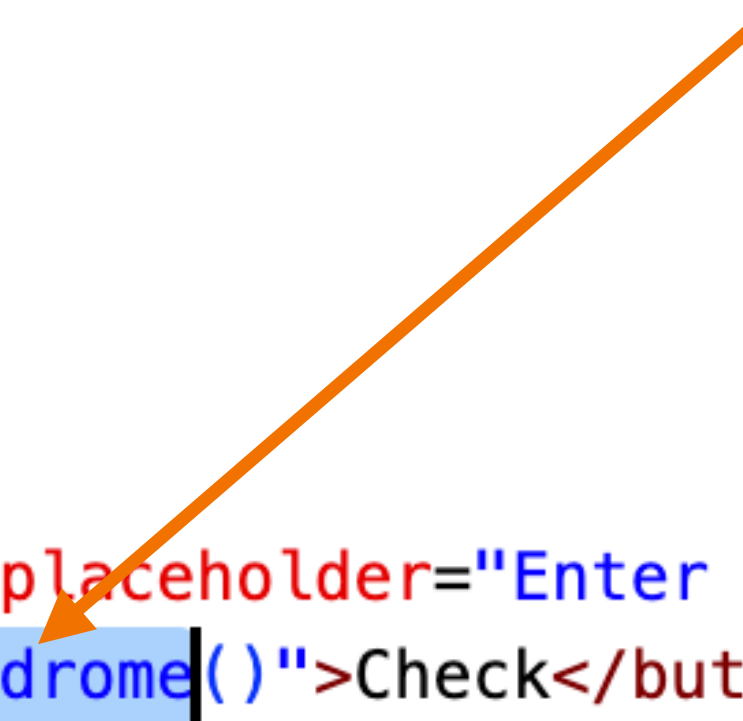

```
<body style="background-color: powderblue;">
  <h1>Palindrome Checker</h1>

  <div class="input-group mb-3 w-50">
    <span class="input-group-text">Enter</span>
    <input type="text" id="check-pal" class="form-control" placeholder="Enter word or a sentence">
    <button class="btn btn-primary btn-md" onclick="isPalindrome()">Check</button>
  </div>

  <script src="index.js"></script>
</body>
```

Use onclick() to call the above function.

Testing

Update the page

Finally update the index.js page. Steps are:

- 1) Lower the input string given by user.
- 2) Create a check function, and inside create a dummy empty array
- 3) Iterate through input string, if the char is valid between a-z, append the char at dummy empty array
- 4) Iterate through created dummy array and if front and end character is not same return false, else return true
- 5) Finally set alert to the user as well as reset the user input

```
JS index.js ×
Palindrome > JS index.js > ...
1  const userInput = document.getElementById("check-pal");
2
3  function check(value){
4      str = []; //create an empty array and build a list
5      for(let i=0; i < value.length; i++){
6          achar = value.charAt(i); //char at index
7          if(achar >= 'a' && achar <= 'z'){ //make sure it's between a-z
8              str.push(achar); //append to the str array
9          }
10     }
11     //above could also be achieved by str= value.split(""), but we want
12     //show array is built from a string
13
14     start = 0;
15     end = str.length - 1;
16     while(start < end){
17         if(str[start] != str[end]){ //if char do not match
18             return false;
19         }
20         start++;
21         end--;
22     }
23     return true; //default
24 }
25
26 function isPalindrome(){
27     let value = userInput.value;
28     value = value.toLowerCase(); //make lower case
29     if (check(value)) { //if true
30         alert(value + " is a Palindrome")
31     } else {
32         alert(value + " is NOT a Palindrome")
33     }
34     //reset the input string, this will reset
35     //at the UI screen input type text to nil
36     userInput.value = ""
37 }
```

Update the page

Do testing and see program works, and that's it.
